

## Sphere with Two Flowers

Adapted from a NAPP tutorial By Carol Weaver

1. First choose a photo and make a copy, then fill the original background layer with black (edit then fill).
2. Reselect background copy layer.
3. The image needs to be square. Go to image-size and change dimensions so they are square (constrain proportions off).
4. With the background copy layer selected, go to filter-distort-polar coordinate and select polar to rectangular. Click ok.
5. Go to edit-transform-flip horizontal.
6. Go to edit-transform-flip vertical.
7. Run the polar coordinates filter one more time, now select rectangular to polar. Check ok.
8. Press D then X to make black the background color.
9. Go to image-canvas size and increase size by 2 inches on all sides.
10. Make the background copy layer active and select elliptical marquee tool. Options bar set the feather to 0, anti-aliased checked, style to fixed aspect ratio, and set width to 1 and height to 1.
11. Make a selection around the sphere, leaving the extra color out of the selection.
12. Select inverse and hit the delete key. Deselect.
13. Do inverse again.
14. Go to the gradient tool and select the white to transparent square. Then from the center top draw a line down to the center. Deselect.
15. Got to edit transform-perspective and move the bottom in a little.
